PulseWorx Gateway
The Windows PulseWorx App

In addition to the PulseWorx app for the iPhone and iPad there is also a Windows application that works on any Windows computer that use all the post-XP Windows versions including Windows 10. The application was specifically created with the idea that it may be used on touch-screens. Therefore, it also works great with the Microsoft Surface Pro tablet.

In many ways this Windows application operates similar to the mobile iOS application: After connection the icons for the rooms in the installation display.

A click (or tap if you have a touch screen) on a room icon displays the devices in the room. Tap on a device and the device is controlled. A long tap – or double-click from a mouse – opens a control panel for the device. At this point the device level can be set or, if a keypad device, a keypad button pressed.
Also like the mobile applications, the schedule can be viewed and edited.

An advantage of the Windows PulseWorx application is that sometimes it’s just easier to work with a larger screen and a real keyboard especially when creating or modifying schedules.

For installers, to give the homeowner the ability to edit schedules on a large screen, the Windows PulseWorx application is much more preferable then having them use UPStart.

While the popularity of Apple devices is undeniable, you will see more and more of the Microsoft Surface tablets being used so don’t forget that this tool is available as well.
